

Euro-Lite™ About the Product

Our Euro-Lite products are made of a high density polymer, which creates a virtually indestructible, architecturally appealing product. Construction properties are almost identical to construction grade Douglas Fir. Unlike wood, Euro-Lite is impervious to rain, wind, sun, vermin, and insects.

As with wood, polyurethane products are subject to expansion and contraction with differences in temperature and climate. To reduce the effects of environmental changes, it is recommended that installation and storage guidelines be strictly adhered to. When properly painted, Euro-Lite products will withstand the ultimate test, which is time.

Euro-Lite pieces come primed and ready to paint. Installation instructions are included with every purchase. Standard tools may be used to install Euro-Lite product. Because it acts like conventional building material, you can nail it, screw it (we suggest using typical drywall anchors when using screws) or bolt it, along with using construction adhesive.

Use Euro-Lite products anywhere around the house or yard. Next to the pool or Jacuzzi? No problem. Euro-Lite can't (when properly painted) be damaged by water (salt or fresh). Euro-Lite balusters make a great accent to entryway steps, or use them as a perimeter around the front yard. Euro-Lite balusters are commonly seen on the second floor balconies and decks. Euro-Lite balusters add to the beauty of any staircase.
